

1 INTRODUCTION

1.1 Overview

This paper describes an image-based agent's pose estimation method for supporting experiments on cricket-micro mobile robot interactions. Crickets modify their behavior selection tendency as a result of experience and the context based on the interaction with other crickets. Such a behavior selection mechanism with a tiny brain is a typical example to understand the adaptability of animals.

1.2 Purpose

Pose estimation is one of the issues that have gained many benefits from using state-of-the-art deep learning-based models.

Human pose, hand and mesh estimation is a significant problem. · A Human Pose Skeleton represents the orientation of a person in a graphical format. · Implementing in the Domain of Cricket

2 LITERATURE SURVEY

2.1 Existing problem

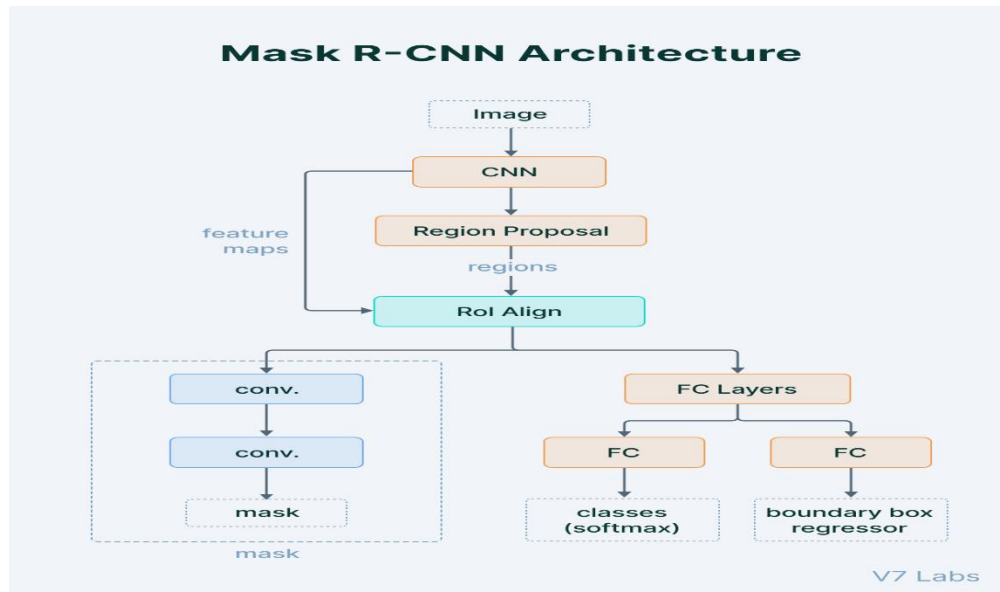

In the existing approach the analysis given just for upcoming matches for upcoming by their self without analyzing more a past data's. while using with onpast data no one given a diagrammatic representation about data and its output what are things need by public. More often the existing problem not clearly gives solution to their problems.

2.2 Proposed solution

As a basis of measuring the process performance in existing problem, the measurement of data and its output accuracy is accurate with more dataset testing has shown that the proposed system produces relatively accurate indications of actual performance of construction projects. Using of diagrammatic representation reach the public easily and also attract easily.

3.2Hardware / Software designing

- Deep Learning-CNN
- OpenCV
- Watson Studio
- Media pipe.
- Google Collab

4 ·EXPERIMENTAL INVESTIGATIONS

- This method can be used by Cricket Association Boards and Sports Analyst for recognizing the pose of a player and at which point he is weak and which part of the body helps him to give him a edge up in his performance.
- Analyzing pose of a cricketer while Batting, Fielding or Keeping will help in analysingscores and future performance of the team

V

5 RESULT

The objective of this solution is to create a dashboard that visualizes the following capabilities and also forecasts the future results

- Improve the accuracy, you can play around with different hyperparameters like increasing the number of hidden layers in the model.
- Changing the optimizer, changing the activation function, increasing the number of epochs, and much more.
- I hope you are already familiar with the hyperparameter tuning for the neural networks do try them out at your end and share your performance in the comment section.
- So, this is how we can build a model to classify the shots using the pose of a player.

6 ADVANTAGES & DISADVANTAGES

ADVANTAGES:

Diagrammatical representations make people to understand easily about our solutions easily.

More reliable Data's.

Easy to understand about data.

Accurate information.

User Friendly.

DISADVANTAGE

There are no more modules in the proposed system.

7 APPLICATIONS

Using of Diagrammatical representations people to understand easily about our solutions easily.

Using of Watson Studio and Google Collab makes creator easily update about future update Solutions need by people.

8 CONCLUSION

Thus, the project is created a dashboard which predicts the Indian Premier League that visualizes some of the capabilities like finding the team that won the greatest number of matches in the entire IPL, find the team that lost the greatest number of matches in the entire IPL, etc... and also analyzed such vast amounts of data which will give great insights in forecasting match results, top scores, city hosted mostly and wicket takers.

9 FUTURE SCOPE

This model is used for predicting the outcome of the match based on historic data. During the extraction of features various features has been involved but most important features has been taken during prediction. Using a team structure in terms of slots which defines most important slots contributing to match winning and a ranking system for the players through their performance statistics. We are using algorithms to cluster all players according to their performance and used to find interchangeable player to a particular player.
